

It Pays To Be Proactive

How structured account management can grow your MSP

Introduction

Most managed service providers (MSP) founders and leaders have a technical background. They have built their business through technical excellence and service delivery. There is no doubt this is critical to any MSPs success.

However, our analysis has shown that the point of difference for the fastest growing MSPs we work with is how proactive and structured they are in their sales and account management. It is not just an outcome but a process.

They know, measure and focus on what levers grow their business, whether that be acquisition, growth within accounts or superior service.

In particular, it is our belief that many MSPs are leaving revenue on the table with their existing customers. Improving upsell and cross sell is often the most effective means of achieving growth in this current environment.

In this e-book, we will describe the key levers for growth at your MSP, give you tools to review if you have the right people in the right seat and give you actionable recommendations on how you can implement a 'pro-active account management' approach.

The growth levers for an MSP

First up, are you looking to grow?

A lot of advice and media in the MSP industry is based on the assumption that every business is focused solely on growth. More clients, greater revenue, and a bigger team.

However, I'm sure we all know MSP business owners whose 'why' is not growth and an ever-larger exit. Instead, some want to build that lifestyle business and spend more time with the family, while others enjoy being the key cog in the wheel for their clients and don't feel the need to delegate. Arlin Sorensen, Vice President of Peer Groups at ConnectWise, recognised that MSPs can be grouped based on their motivations, proposing most fit into 4 classes:

1. Servitude – living to work as an individual entrepreneur
2. Lifestyle – often founder centric, this is about lifestyle as a goal not exit
3. Growth – consistent revenue and profitability improvements are the focus
4. Hyper-growth – dedicated focus on rapid growth for exit

“Is Growth your goal?”

As you know, building an MSP of any form requires a lot of blood, sweat and tears. Therefore, it's important to understand your 'why'. So before reading the rest of this paper and thinking about how relationship management can help you grow, first we ask you to ask yourself: is growth your goal?

When you envision your business over the next 1, 5 or 10 years, what does it look like? A significantly greater number of clients? A larger team and more revenue? If so, this is the right white paper for you.

The top line revenue levers for growth

Now you have self-identified as an MSP with growth or hypergrowth ambition, it's important to understand what levers you can pull to grow your bottom line.

The MSP business model is unique. Relationships with clients are long and the revenue model varied. Sales is not solely pitch, close, and forget.

Instead, you grow your business with clients over time, across a variety of sources: managed service contracts, tailor-made services and projects, and resale of both hardware and software.

This unique dynamic means revenue growth is not down to a single marketing and sales funnel. Instead, you have 3 viable and interconnected levers to growth:

1. Strong retention and referrals in profitable accounts
2. Acquisition efforts through sales and marketing
3. Revenue growth within existing accounts

1. Retention and referrals through service excellence

Delivering exceptional service is the most critical outcome for an MSP - this is the bread and butter of the MSP industry. If you are a leading organisation here, you will see it in your balance sheet.

High retention means you need to acquire fewer new customers to meet your growth goals. Otherwise, it does not matter how effective your sales and marketing efforts are if there is a consistent revenue shortfall from customers leaving.

As we will explore later, MSP Monthly Recurring Revenue (MRR) within accounts usually grows over time as trust is built. Dissatisfied customers will not buy more products and services. Too much of this and you will lose the ability to grow margin over time with your existing customers.

Happy customers are referrers and referrers are the most cost effective and converting source of leads for MSPs.

Strong early growth can be earned solely from a focus on leads generated through happy customers. In fact, Datto's state of the MSP Nation report identified referrals as the largest source of new clients for 64% of all MSPs.

However, don't just take this as a given. If you are delivering exceptional client experiences – make the most of it. Incentivize referrals through prizes, rewards, and finder's fees.

2. Acquisition of new clients

While referrals are often enough early in your journey, as you get above \$1-2m in revenue, proactive acquisition is both required and effective.

From the Datto State of the MSP Nation report in 2020, the average number of clients for MSPs was 127. Typically, even an aggressive growth target would mean acquiring 1 new significant client a month.

Fortunately, the payback period of acquiring that profitable client will likely be high with even moderately effective sales and marketing efforts.

Unfortunately, data from Service Leadership shows that marketing and sales performance in even leading MSPs is typically below best practice in other industries. Their benchmarks found that the average MSP sales rep brings only 2.5 new clients per year and returns only 120% on their wages in gross margin.

Marketing

Often, when MSP's want to be proactive in sales they focus on marketing. Marketing in all its forms is the most inconsistent method of growth we see from our partners. All too often, directors spend too much of their time wrangling vendors for co-op funding and seeing very little to no return.

“Too many MSP sales people are tasked with closing leads that do not exist”

3. Growth through greater share of wallet over time

This final lever is the focus of this paper. One of the key advantages MSPs have is that growth is not purely a function of client numbers. In fact, most of our larger MSP partners had the bulk of their business growth come from growing spend with existing customers.

This makes sense: an MSP at its best is an IT partner for their customers. As you develop your relationship, the needs of that partnership grow. This trend is accelerating with the dramatic increase in technology adoption in the SMB market.

Often, this takes the form of starting with a simple, defined managed service contract. However, as you build trust with the businesses leaders you identify:

- **Missing solutions that you can add to** the service you provide. For example, many MSPs have grown significant revenue by selling more security solutions to their customers because of the COVID-19 pandemic on remote working.
- **Their existing hardware and/or software spend** that would be more effectively managed by you.
- **People capability** that you can uniquely provide, in the form of custom implementations, consulting or even vCIO services.

With no additional acquisition costs, we see successful MSP partners double their MRR and gross margin within key accounts through a real focus on true proactive account management.

Why relationship
management is
critical to growth

What ties it all together?

Relationship management

Ultimately, people buy from people. Being an IT service provider is about building relationships. While service delivery and technical competence is a must, to really achieve strong growth over time you as a leader must push your team to be more effective at sales and relationship management.

It can be your differentiator.

When discussing relationship management in MSPs, there are many roles, responsibilities and processes brought up. BDMs, VCIOs, account managers, sales reps, customer success - it all can be a bit confusing.

Role clarity and fit is important but ultimately, relationship management within an MSP generally boils down to 3 sets of responsibilities:

- **Hunting**
- **Supporting**
- **Farming**

Hunting

Hunting refers to generating new clients. Depending on your client size and typical ARR, it can involve both:

- Lead generation through prospecting and networking
- Closing inbound leads from pitch to signature

This responsibility requires a laser focus on conversion, persuasion, and a tenacity to bounce back from rejections and objections.

Supporting

Supporting involves acting as the bridge between your client and your internal operations to ensure clients get the service they need. This can encompass being the traffic cop for important tickets into your help desk, facilitating upgrades/fulfilment and solving any issues that arise when it comes to billing.

Typically, these activities are 'reactive' to the requests of the client.

Farming

Farming is the process of developing relationships with your existing clients' business leaders to understand additional services they need and generate more revenue from them on a recurring basis.

It is often an act of developing patient and consistent development of relationships. Regular check-ins, QBRs and ideally social catchups allow you to understand business context and therefore offer more.

What's the difference between farming and supporting?

The key difference is that farming is about proactively owning the business relationship. The person responsible for farming is on the lookout for opportunities to grow.

Conversly, supporting is about delivering the best experience possible to reactive queries.

Who's responsible for what?

This changes as you grow

The people and roles that are responsible for hunting, supporting, and farming is not one size fits all. Each step in the MSP journey from day 1 to building out large sales and account management teams often involves changing responsibilities.

Typically, we see the progression of how an MSPs approach to customer relationship management grows resembles the infographic on the page below. There are key decisions any growing MSP will have to face along the way.

Stage	Hunting	Farming	Supporting
Early	You ARE the business. While you have support, ultimately you are the point person for clients at every stage of the cycle.		
Founders as sales	As a founder, you take responsibility to bring in business. As a one- or two-person effort, by definition, it involves both farming through QBRs and hunting new prospects.		Your new operations leaders take on much of the support burden.
Hiring your first salesperson	Key Decision: at this point, you need to decide on a focus. Typically, an MSP will either: • Split both farming and hunting between the salesperson and the founder • OR the new salesperson is given responsibility over new client acquisition, while the founders handle QBRs.		At this point, an MSP may hire success or account managers, but the bulk of supporting is handled by your help desk.
Running an at-scale sales and account management team	Key Decision: As you grow, it becomes more likely you separate hunting and farming as separate roles. Sales BDMs are given sole responsibility for new client acquisition.	Key Decision: At scale, you now can build a dedicated account management function. This can take many forms: • You create a virtual CIO (vCIO) offering – a person responsible for increasing share of wallet. This requires hiring technical account managers to take over supporting • OR you build a dedicated account management team: responsible for farming and supporting, they are tasked with retention and growth of revenue from existing clients.	

The key decisions related to relationship management

As an MSP leader, you would know that there is often a tension between working IN the business vs working ON the business. This becomes more pressing as you grow and delegate responsibilities. When it comes to relationship management and sales, this creates critical decisions that require an intentional and structured approach.

In particular...

- When do you hire your first external salesperson?
- Should you split your hunting and farming between two separate roles given they require very different traits? If yes, when should that happen?
- At scale, how do you approach proactive account management? Will your customers adopt a vCIO offering or is a more traditional account management offering to all customers a greater way to build revenue?
- How do you ensure proactive account management is not swamped with 'supporting' activities? Exceptional service to end-user requests is important but should not preclude your business from being proactive in building business relationships with leaders.

The answers are not one size fits all. However, there are activities you can do to get to those answers, get clarity on roles and ultimately better results across farming, hunting and supporting.

Getting accountable: map your team, responsibilities, and the levers to pull

At BeeCastle, we have seen the success MSPs have achieved by adopting the methods and philosophies of Entrepreneurial Operating System ([see more here](#)). We are strong supporters of their principles of:

- Get the *'right people in the right seats'*
- To assess fit, ensure they *'Get it, Want It and have Capacity to do it'*

Mapping your current situation

In that spirit, we would recommend every MSP sits down with their leadership team and first map out the current picture:

- Who in the businesses is currently accountable/responsible for your key levers of growth:
 1. Hunting
 2. Farming; and
 3. Supporting your clients?
- Do you have clear goals or definitions of success for each of those levers?
- How do you measure or track those levers?
- Is it clear who is responsible for those goals?

- Is the person responsible for that goal
 1. the right person and
 2. are they given the time and capacity to achieve that goal?

Common MSP pitfalls

Often, themes emerge when MSPs work through the above.

We too often see that:

- Having key responsibilities like new client acquisition being a 'part time' job for a founder or salesperson - results in part time results
- Unclear accountability – 'It's all our responsibility' can often mean no-one is truly accountable
- Not enough dedicated focus – salespeople or account management are swamped with reactive supporting tasks that they cannot possibly dedicate the time to proactively build opportunities
- Wrong people in the right seat – often we see people hire 'salespeople' who are naturally farmers but are asked to hunt and then questioned when results are poor.

How to map clear responsibility for hunting, farming, and supporting

With the above in mind, now map out a new clear accountability between hunting, farming, and supporting and the people in your team. Who is accountable, what is measured, what skills are required and is the person the right fit?

Simplicity makes it work. A single person or team owning a key lever means you have dedicated focus. They will know what activities they own, reduce the 'noise' and be accountable for improving those measures.

However, it doesn't stop at the just completing this table at an offsite. The whole team must clearly understand their accountabilities and you must integrate success measures in your weekly, monthly, and quarterly operational rhythm. As the saying goes 'we do what is measured'. With a little focus and consistent accountability, you will see results.

Accountability	'Lever' they own	Measure of success	Skills required	Role
Hunting	Acquisition of new clients	No. of new clients Margin earned by new clients	Self-starter Conversion focused Resilient	Sales BDM
Farming	Share of wallet from existing clients	Growth in margin from existing accounts Increased product/ agreement penetration for focus area	Relationship builders Patient and solution oriented Deeper with less	Our Account Managers
Supporting	Retention	Increased product/ agreement penetration for focus area	Process and customer focused Technically capable	Our Service Delivery leads

Let's deep dive
into the value of
farming & account
management

Let's focus in on 'farming' and account management...

We find that across all sizes of MSPs that farming is the most underutilised and unstructured growth lever. We believe that many MSPs are leaving margin and growth on the table by not building a structured process and discipline around selling to their existing accounts.

Let's look at what 'proactive account management' actually is and how you make it happen in your MSP.

What it is...

- Measuring engagement with your client's decision makers
- Making the effort to understand your customers strategic context

What it isn't...

- A measurement of service delivery or ticket resolution
- Resolving support or billing queries

What is proactive account management?

Proactive Account Management is the discipline of regular, structured engagement with the key decision makers and influencers in your existing accounts, with the intention of uncovering problems and identifying cross-sell opportunities.

The key words here are regular and structured. Too often we see account management that is based on intuition, is unmeasured and often uncoordinated.

Historically, 'account management' for MSPs has been a reactive role – providing sales, service and billing support. While being proactive and disciplined with QBRs is talked about, often the team are not given the time or headspace to do it properly. Too many tickets, too little time.

Instead, the most successful MSPs we work with create programs and, if possible, a dedicated role that is built around proactive engagement. It is only through a dedicated focus on managing and farming key accounts that you'll get strong bottom-line growth from existing accounts. Part-time approaches based on intuition lead to underwhelming results.

What will it do for my business?

As we've touched on before, regular proactive engagement with a decision maker outside of the support tickets builds trust. Developing trust, time to understand their business

“Improving retention by just 5% can increase profitability by 25 to 75%”

context and regular opportunities to engage will:

- **Increase retention:** Regularly gauging the sentiment of decision makers will quickly reveal the lingering issues with your business relationship that eventually lead to churn
- **Increase upsell and cross-sell rates:** Structured proactive ‘farming’ will make you better placed to provide more varied services to customers when they need them. You become the ‘default’ choice for difficult technology problems

We can learn from our vendors on the importance of effective upsell and cross-sell

The vendors and large technology consultants that we sell to and partner with understand the power of proactive account management. While the business model is different, ultimately, they think of growth through the farming, hunting and supporting framework.

Consistently, sales-led software companies highlight existing customer growth as their most effective growth channel. A Hubspot study identified that for SaaS companies:

- They generate over 35% of new revenue from existing clients.
- Net revenue retention, which is defined as the rate of retention/growth from existing accounts, is the critical KPI when valuing a company
- Benchmarking studies estimate that for SaaS companies it costs up to five times more to acquire a new customer. As such, increasing retention just 5% can impact profitability by 25-75%

Signs you may need a proactive account management program

You may think 'we regularly check-in with customers – what's the difference?'. You likely do and see benefits from that activity. We suggest a program that creates more focus and rigour to get even better results.

Even successful MSPs are leaving growth on the table. Here are some symptoms that could indicate you need a more structured account management program:

Are your sales 'set and forget'?

When looking at the data do you struggle to upsell premium solutions or introduce new product offerings?

If you can, review the agreements, products and projects you sold to your key existing customers this year.

- How broad are the set of new products and services you sold?
- Is most activity centred around the services you already provide? Renewals or cross-sells concentrated on one product line?
- When introducing new solutions or vendors, do you struggle to get traction? Are the vendor led marketing campaigns ineffective?

If the answer to the above is yes it may indicate that having more regular engagement with key clients will deepen your relationship, put you in a position to influence roadmap more and ultimately become more effective at selling whole-of-business IT.

Have you experienced customers churning even though your NPS and/or CSAT scores are high?

Most customer satisfaction measurements are captured 'within the ticket' and is a good measurement of your service delivery. However, it likely does not measure the relationship and perception of the decision makers within those accounts.

We see it happen all too often: MSPs who are doing a brilliant job but have limited relationship with the business leaders only hear of new opportunities after a competitor has secured them. Slowly the new voice is the one that is trusted with new projects and suddenly, the customer churns.

You must ensure regular communication with decision makers is a core part of your offering – it's insurance against your most important asset.

If either of these resonate, it's time to implement a structured account management program...

How to implement effective proactive account management

How do you implement a 'Proactive Account Management' approach?

It's relatively simple but does require some planning. Here are 5 steps you and your team can make to implement a more proactive account management approach:

1. Segment and tier your customers
2. Set internal expectations around engagement with those tiers
3. Use scorecards to create accountability and measurement
4. Let the data guide you: the types of touchpoints your rep can use to build deep relationships
5. Have value-led conversations with existing customers

1. Segment and tier your customers

While every customer is important, some are more important than others. Clearly defining which customers are your most important by segmenting your customer base into tiers, means your account managers can be strategic with their time and effort.

Based on the Pareto Principle or the 80/20 rule, 20% of your accounts likely make up 80% of your revenue. Therefore, a typical starting point to segmenting your customers is your customers' dollar value, whether that be existing or potential revenue and margin.

This simple act will align your team around what is expected for each tier of customer. You can now explicitly create plans for these segments and provide differentiated service, rather than ad-hoc contact based on who is the loudest.

2. Set internal expectations around engagement with those tiers

Once your tiers are defined, setting clear engagement expectations for each tier, including the type of engagement and the frequency, will be essential for not only measuring your account managers, but helping them achieve results and reach KPIs.

An example from the same MSP above depicting how regularly an account manager would be expected to engage with each tier....

Leading Activity Indicators

- ✓ Monthly trend of key client meetings for rep
- ✓ % of Tier 1 accounts with call or meeting within the last month
- ✓ % of Tier 1 & 2 accounts with QBR complete

Financial Outcomes

- ✓ Net existing customer revenue growth
- ✓ Net existing customer margin growth
- ✓ Penetration rate for (new product offering)

Customer & Retention

- ✓ No. of Key accounts lost
- ✓ NPS of customer decision makers

3. Use scorecards to create accountability & measurement

Structure and expectations are important, but easily forgotten in the rush of daily business. As the saying goes, what is measured is done.

Therefore, to embed the good practice of proactive account management you must measure whether your team are meeting the expectations decided in point 2. The measurement and who is accountable should be clear.

These measures should sit alongside your operations, service delivery and sales scorecards as key leading indicators for your business. Incorporate into your weekly sales meetings, your quarterly reviews or your level 10 meetings.

While the scorecard will be different for each organisation, the example shown is of a quarterly scorecard we've seen successfully used by leading MSPs. This set of KPI's make it clear to an account manager that regular engagement, effective cross selling and a focus on decision maker relationships is critical to their success. On page 42 and 43 we set out some of the scoring metrics that BeeCastle can provide to help you do this.

4. Let the data guide you: touchpoints to build deep relationships

When thinking about who and how to engage with your customers, some of the most successful MSPs we work with expect their account managers to incorporate different types of touchpoints in their proactive account management plan.

Some of the most common and effective types of engagements include

- a. Formal/structured engagement through QBRs
- b. Informal or social touchpoints
- c. Campaign driven conversations
- d. Reactive engagement

To develop authentic and valuable relationships that get you results, it's important your account managers not only regularly engage, but engage with the right people. To save time and sell higher value solutions, engaging with key contacts like decision makers and influencers in your accounts will likely make your engagement plan more effective.

Lets review each of those engagement types:

a. Formal/structured engagement: The Quarterly Business Review

The QBR is an excellent opportunity for account managers to have a business led conversation with customers. Not only do they provide a regular forum to highlight new or relevant services and products, but also the chance to demonstrate how you provide value by helping them set and achieve goals.

The key to successful QBRs is consistency, by measuring your account managers on the regularity and frequency of QBRs, you can ensure your key customers are getting at least quarterly facetime with your team.

For templates and resources on QBRs, check out these guides:

- [Do you have an annual QBR playbook by Managed Services Platform](#)
- [MSP quarterly business review templates by Ninja RMM](#)

b. Informal or social engagement

The QBR is your formal touchpoint. However, most of the opportunities to grow an account are not raised in that session and it instead is the way of formalising the plan. A strong account manager deliberately has conversations outside of the QBR and service tickets to capture these opportunities.

Face-to-face onsite visits, coffees and dinners all provide great opportunities for authentic relationship building, as well as getting an inside view of how things are going within your account.

While informal engagement might be common in the MSP world, it's important that they are deliberately and consistently arranged. Once that expectation is set with your team you can set KPIs to ensure this is happening in your Tier 1 and 2 accounts. This KPI will quickly become a leading indicator for sales and cross sell.

For your sales and account reps to be most effective they can use a data driven approach to prioritising this work. They can regularly review their interaction data to identify any accounts where decision makers haven't been touched recently, and then plan an informal catch-up as a way of re-engaging.

c. Campaign based

If you are going to market with a specific product or service, you need to think about both your audience and proposition. Too often we see MSPs given marketing materials from vendors which they blast to all their customers and see disappointing results.

We believe the art to cross-selling is understanding where the 'white-space' exists in each of your accounts and having the right conversation with the right customers.

As such, we recommend that MSPs conduct 'whitespace analysis' when they go to market with a new campaign or offering.

Whitespace analysis is the process of examining sales data to find opportunity for cross sell and upsell in your existing customer base. The term 'whitespace' simply refers to any gaps in a customer's needs that you could fill with your products or services.

To kick off a whitespace analysis, layout visually your agreements, products and services and which of your customers have signed up for those agreements. Then analyse the existing accounts that don't have the service that would be most likely to be interested. These become your account managers target list.

Whitespace analysis tools help you and your account managers focus your time by allowing you to identify where cross sell and upsell is both possible and likely.

d. Reactive support

As discussed earlier, it is up to you to whether your proactive account managers are responsible for 'supporting'. If they are, it is important that these types of touchpoints are part of their scorecard.

The metrics that MSPs can use to measure support are well known and we will not go into detail on them. If you'd like to learn more around what service delivery metrics you should measure, we recommend reading ['ConnectWise Metrics that Matter for MSPs: Ticketing'](#) from CrewHu.

One word of warning: often this reactive support becomes overwhelming and the account managers do not have the capacity for the other critical activities. This shows in the data as the account manager has many interactions and tickets with the company but very little engagement with decision makers.

If you see this trend you have a decision to make: do you split the supporting function to another role or do you accept poorer results in upsell and cross sell?

5. Have value-led conversations with existing customers

Once you have your account managers organising regular, consistent and diverse engagements with your customers, the final step is to make sure they know how to communicate the right message.

Focus on value and outcomes, not features

As discussed earlier, the aim is for your account managers to be talking to a decision maker—a CTO, a CEO. They are usually someone who doesn't necessarily work with technology everyday and are likely to be more receptive to messaging focussed on economic outcomes as opposed to productivity or automation.

MSPs have a tendency to fall into the technical implications of deploying a new solution and get lost in the weeds with all of the different features. Instead, focus on what will this solution do for your customer's business?

Highlight the value you will bring to their business that is different to anyone else – what value does your MSP add to the product you're offering?

Here are a few simple examples:

- By implementing our new cyber security training services your staff will upskill their security awareness through our quarterly cyber security training and phishing simulation - saving you thousands in ransom fees.

- By keeping up to date with our disaster recovery and backup practices you will be better positioned to take on more executive clients as they will have peace of mind that their data is secure.
- By implementing Microsoft Teams, we can transform your business to a modern workplace - attract new talent, improve productivity and be better positioned for future technology solutions.

Keep it personalised

Customers want to feel special. You are much more likely to spark a conversation if the solution has had their business and technology in mind when reaching out rather than blasting a marketing EDM.

Consider your past engagements and focus in on the pain points that were raised.

Has there been a problem with a router in an office that has created numerous amounts of tickets that could be replaced?

Are there self-serve options for basic requests such as password resets, email provisioning, printer deployments etc?

Creating context to a conversation will go a long way with getting your point across and ultimately expanding that account.

About BeeCastle and why we care about proactive account managmenet

BeeCastle and Proactive Account Management

At BeeCastle we care about proactive account management and built a product to reduce the effort and overhead required to implement a program like this.

Working with customers every day to develop and introduce programs like this, we've seen how automated insights, real-time dashboards and simple onboarding make it easier for MSP sales leaders to get accountability, measurement, visibility and ultimately, results.

BeeCastle helps reduce effort to measure your team by automatically ingesting and analysing your Microsoft 365 data, and your customer data held in your CRM or PSA tool(s).

The result is real-time, automated dashboards without ever needing to manually log activities.

The User Analytics dashboard gives you insights like what type of interactions, what level of activity to provide you richer data for your 1-1's with your account managers, and to ensure productivity and accountability.

Automated Team Activity analysis. Get the data to measure and coach your team on whether they are hitting their account management KPIs and where they are spending their time.

Identify at-risk accounts to ensure no opportunity is missed or decision maker at a key account is forgotten.

Measure engagement in your segments to keep yourself accountable to your scorecards and build actionable plans based on all users have access to metrics like....

- trends in first meetings
- most and least engaged accounts
- % of key accounts called or met with
- recent interactions with Decision Makers
- a leaderboard to track KPIs

Identify whitespace sales opportunities using automated analysis to match profitable products in your stack with gaps in your offering to existing customers.

and much more...

Designed to work alongside your operations and service delivery aspects of your MSP, BeeCastle can give both you, your account managers and your sales team the visibility and accountability to succeed.

Summary

Summary

If you're an MSP looking to grow, you're likely already very busy – we understand! However, our experience with some of Australia's most successful MSPs is that a structured approach, while requiring some work, pays for itself in the long run.

By clearly defining the role of your account manager, dedicating responsibility for that lever, and incorporating structure and measurement around this role in your business, you can significantly expand your margin from your most important resource – your existing customer base.

We recommend you think about creating a proactive account management program, and at a minimum implementing some structure and rigour around it. A specific, replicable system you can begin introducing today can be simplified to just...

1. tiering and structuring your customer base
2. setting clear expectations and accountability for your account managers
3. measuring a broad range of regular and consistent engagements

While acquisition efforts through sales and marketing, are also key contributors to MSP growth, they do not tell the full story.

We wrote this e-book because we've found that across all sizes of MSPs, a focus on farming and growing share of wallet is the most underutilised and therefore unstructured growth strategies.

By defining the opportunities that you can unlock through proactive, structured account management processes, as well as establishing what proactive account management actually involves, we hope this e-book has given you the tools to start making it happen in your MSP.
